

XAUConnect Gold Curve

A launchpad that is already live. You pick a published curve, sign once, and people can buy the token immediately. At exactly 10 SOL or 750 USDC, Meteora moves the pool into a locked DAMM v2 market.

Website: <https://xauconnect.com>

Code: <https://github.com/akhilexx/xauconnect>

Live token: XAU Gold Curve (XAUGC)

WHAT YOU ARE LOOKING AT

One site. Six recipes. Real pools.

XAUConnect is a multi-chain app for launching and trading tokens. The front door is Meteora. Open the homepage and you are already on Solana, on a Gold Curve.

Fair

One even price path. The trading fee stays at 1% from the first buy to the last.

Shield

The fee starts at 50% and falls to 1% over 10 minutes. The token page shows the clock.

Distribute

Three parts: a fast start, a deep middle, and a steep last mile. The fee stays at 1%.

Each recipe exists twice, once for SOL and once for USDC. That is six partner configs, created once from the XAUConnect fee wallet and reused by every launch. A new token does not get a new set of rules. It joins a recipe a judge can open on Solana.

Graduation is not a custom number. It is exactly 10 SOL, or exactly 750 USDC, because those are the amounts Meteora keepers already watch. When the pool fills to that line, the keeper migrates it. We do not run our own migration bot and hope.

THE FRONT PAGE

Launching is the home page.

The first screen asks you to create a token. Meteora is selected. The four beats across the top are the whole product, in order.

- **Create.** You sign one transaction. The token and the pool appear together.
- **Trade.** Anyone can buy or sell immediately. There is no waiting list.
- **Fill.** The pool fills to exactly 10 SOL, or 750 USDC if you chose USDC.
- **Lock.** Meteora moves it into DAMM v2. The liquidity stays locked.

Recent launches sit under the form, in the same centered column. XAUGC is already there. It is a real Fair pool on SOL, not a demo row.

One path. One fee. No surprises.

Fair is the simple recipe. The price walks one even path from the first buy to graduation. There is a single segment, named Even on the token page. Liquidity is spread evenly along that path, so a buyer is not walking into a cliff or a hidden shelf.

The fee is fixed at 1% (100 basis points). It does not change with time. The token page says "Fee now 1%" and "Final 1%" because they are the same number on purpose. Fees are taken in the quote token, SOL or USDC, not in the new token.

The creator keeps half of the trading fees earned during the bonding phase. The other half goes to the XAUConnect partner wallet. That split is on the config, not a promise in the interface.

SOL
ExTrSGZBjzMrueBNHEALCCJmppB9zpoTSWJea4iR2gQu

USDC
Hrro7hmEAXyN9uGgMWwDwosJiuCjhXcVn6xGw5pChBn8

Graduation
10 SOL, or 750 USDC. Keeper migration into DAMM v2 at a 1% pool fee.

SHIELD

A high fee at the open, then it cools down.

Shield is for a launch that expects a rush in the first minutes. The fee starts at 50% and decays on an exponential schedule to 1%. There are 10 steps, one minute each, so the whole decay takes 10 minutes. After that the fee sits at 1% for the rest of the curve.

The token page is the public clock. While the schedule is running it shows the fee right now, the final fee, and how long is left. A buyer does not have to trust a tooltip. The number is read from the pool.

The price path is still one segment. Shield changes the fee, not the shape of the curve. Snipers pay more in the opening minutes. Later buyers pay the same 1% as a Fair pool.

SOL

5Edj53kFfx2da3dJy9gcxKLZF6W45QYozog5S4hNfA25

USDC

4VyDGF5jS9JqUBQqbijzVDDrtq7T6dHMURNudmwzPKZB

Schedule

5,000 bps down to 100 bps. 10 periods. 600 seconds.
Exponential.

DISTRIBUTE

Discovery, a deep middle, then a steep last mile.

Distribute is three segments. The weights are 1, 4, and 1. A thin first stretch lets price move while people find the token. The middle holds four times the liquidity, so the busy part of the curve is the deep part. The last stretch steepens again into graduation.

On the token page those segments are named Discovery, Middle, and Last mile. The page shows which one the pool is in, as "1 / 3", "2 / 3", or "3 / 3". The fee does not move. It stays at 1% the whole way, same as Fair.

The curve is built so it can hold at least the keeper amount, and the stored graduation line is then pinned to exactly 10 SOL or 750 USDC. Pinning above the curve's capacity would leave a pool that never migrates. We do not do that.

SOL
3sLsCEfr4aCdkczvqy3mM4nyWB4P3Ec6yd9rbQM2Xune

USDC
DT4NYCPLJYjPN8TqHQZrHj1PovVa6xmzRKVKvruc5vWy

Weights
1, 4, 1. Fixed 1% fee. Same graduation line as the other recipes.

Same supply. Same lock. Same exit.

1,000,000,000

Fixed supply. 6 decimals. After you sign, nobody can mint more. Metadata is immutable.

1,000,000 left over

0.1% of supply is held back. After graduation it goes to the disclosed fee wallet, not to a hidden address.

20% migrates

That share of supply moves into the DAMM v2 pool. The pool fee there is the standard 1% keeper config.

100% locked LP

Partner 50%, creator 50%. Both sides are permanently locked. Unlocked liquidity is 0. Nobody can pull the pool.

50% creator fees

During the curve, the creator can claim half of trading fees from Profile. The partner wallet claims the other half.

DAMM v2 only

Migration option is Meteora DAMM v2. No DAMM v1. No rate limiter. Standard SPL token, not Token-2022.

The partner and the leftover receiver are the same public wallet: `ENobDuF4iGAmF1Y211aLj6gXCNpdHBfnNKUyLDdbUabb`. The DBC program is `dbcij3LWUppWqq96dh6gJWwBifmcGfLSB5D4DuSmaqN`. The DAMM v2 1% fee config keepers use is `Hv8Lmzmnju6m7kcokVKvwqz7QPmdX9XfKjJsXz8RXcjp`.

A first buy can be attached to the create transaction, so the creator can be the first buyer in the same signature. It is optional. USDC launches use the USDC configs. If someone needs USDC first, the site also has a swap.

A REAL TOKEN, ALREADY TRADING

XAU Gold Curve, symbol XAUGC.

We launched this one ourselves on mainnet, on the Fair SOL recipe. The pool is real, and it already has a trade.

- Mint: HXXMuNxDSHxhK6QGd4CczTgSiXr1YqNbUdpg9rTbWj5r
- Pool: DvDDoFZiC5RqhuVcPgJsJ865ykaNW4hhhhb62gPjRTwU
- Config: the Fair SOL address on the previous pages.
- A small buy was sent after create, so the pool has a trade on it.

The token page reads the pool. It shows the recipe name, the segment, progress toward 10 SOL, the fee now and the final fee, the creator's 50%, and the lock in plain language: 100% of the graduated liquidity stays locked, split evenly, and neither side can pull it.

Create:

solscan.io/tx/nKprP4Bi8CekQiLqpH1CaAVqxCCaiFL4bas6qhBsgYASvKYNCSDfET8B2XqCdQk

Buy:

solscan.io/tx/kiw51Wphu6wTgiR8fYdonpSXvzd83e2D3sMsGftM4DZ4buhxteNcb4KVpRmYQSa

HOW A TRADE WORKS

The curve first. Jupiter after graduation.

While the pool is still on the bonding curve, a buy or sell is built with the Meteora DBC program. The quote comes from the curve. The user signs with their own wallet. When the pool has migrated, quotes hand off to Jupiter and the DAMM v2 pool. Claiming fees from Profile does not unlock the liquidity.

The swap screen uses the same wallet. The form is a normal card in the center of the page. Limit orders sit under it, so the button stays a button.

CHECK IT YOURSELF

Every claim on this deck has an address.

On the token page, Config and Curve pool are links to Solscan. After migration, a third link appears for the DAMM v2 pool. Profile is where the creator claims. Discover lists the launch with the XAU badge once the create transaction is recorded.

Four steps, then one signature.

1. Network

Leave Meteora selected. The EVM chains are still there for a normal fixed-supply token. A Gold Curve is Solana.

2. Token

Name and symbol. Supply is fixed at one billion. The name, the picture, and the supply freeze when the transaction confirms.

3. Curve

Pick Fair, Shield, or Distribute. Pick SOL or USDC. An optional first buy can ride along in the same transaction.

4. Sign

Phantom (or another Solana wallet) signs the Meteora create. The site does not hold the keys. The token shows up on Discover when it confirms.

The guide on the form changes with the step, so the person creating the token can read what they are about to sign. On the curve step it draws the shape they picked: one rising path for Fair, the 50% to 1% decay for Shield, or the three bars for Distribute. It also names the graduation amount for the quote they picked, 10 SOL or 750 USDC.

That is the whole creator path. There is no second hidden transaction to "turn the pool on." Trading is open as soon as the create confirms.
